

Create the Entity-Relationship model of this Adoption Agency, taking into account the following aspects:

1. Correctly identify entities.
2. Correctly identify the attributes,
3. Clearly indicate which domain they belong to.
4. Correctly identifies the primary key of each entity.
5. Identify the cardinalities of the entities.
6. Identify the relationships.
7. Identification of relationship cardinalities

Event main attribute should be date and location combined because there could be several events on the same day or vice versa many events in one location on several days.

The difference between the domains of the Owner_ID and the Agent_ID is how broad can be the amount of individuals of each entity type, there are fewer agents so an integer should be sufficient.
